Lab#003

Active Directory Domain: Suzie's Domain

Eric Webb and Jon Martin

Learning Objective: The goal for this lab was to set up a domain on our previously created server, and add users and a client.

Equipment: A windows virtual server, windows iso, a computer to access the server.

Notes: On our server, we created a new forest, within which we created domain1. We then promoted it to the primary domain controller. After that, we created the organizational unit Suzie. Suzie has an ip address of 10.136.213.114, and we pointed it to our server for a primary dns. We then changed it's domain to domain1. We added 2 users into the remote group. jrmarin and webbmaster.

Diagrams: N/A

References: N/A

Questions: We made server primary dns to route our traffic through the server. We had to add a \domain1. I assume this is so we can get the right user from the right domain. We use active directory because we can run the whole show from one machine. 1 physical server can have several virtual servers, more effectively using their resources.

Conclusion: Lots of troubleshooting with groups, as we couldn't initially find the default remote group. Overall, a very informative lab.
